

Giubiasco Town Water Swiss Alps

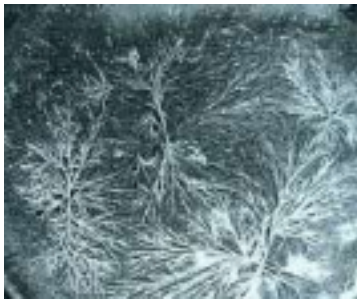

Giubiasco township piped water down from an alpine spring for drinking to supplement its existing town water supply. Before being piped into the town, it was put through an electricity producing turbine. The water then became aggressive, eating into the reservoirs and pipes of the town water system. After post-turbine Flowform® treatment was introduced these problems stopped.

As the water was chemically and organically unchanged from the spring, after turbine and after Flowform, water crystallizations were made to see what was happening to the water at an energetic level.

Increased water energy is able to be assessed by looking at the increased order of its crystalline structure, which indicates negative entropy, or more order in the water

The modern science of electrochemical energy in water is well documented.

Top and bottom photos, with more ordered structure, scientifically indicate a life supporting quality and the middle chaotic crystals, indicate an inability to support life adequately
