

Domaine Marquis d'Angerville

Domaine Marquis d'Angerville (Vineyard)

“ Passing through a live basin has become an essential and systematic gesture during our vinification. It is completely part of our biodynamic practices. The wine thus gains a brighter, more energetic and more vibrant side. Following our scientifically constructed tests over several vintages, this has been validated thanks to numerous tastings but also sensitive crystallization tests carried out by Margarethe Chapelle. ”

Domain House in Belles Lies (Vineyard)

“I use the Vortex when pumping over wine during vinification. Thus, I went from a classic pumping over to a pumping over using the Vortex. We are in natural wine and this makes it possible to better control oxidation, to have less start of acetic fermentation and in general, to have a more regular fermentation. We did a significant crystallization a few years ago, before and after using the Vortex: the result was clear. The center of sensitive crystallization was much more harmonious. There is a definite energy gain. »

Domaine Michel Lafarge (Vineyard)

“The use of Vortex on fermenting whites harmonizes the fermentation and makes it very regular in its process. They allow us to gain complexity and dimension in the wine. »

Domaine Marie Thérèse Chappaz (Vineyard) _ Tristan Le Lay

“We use the basins during vinification to oxygenate the must at a given time when the yeasts need it for their growth. They are used whether for a white or for a red. For two years, I have been using them in two passes, the first, when the tank loses 10 points of density and a second pass the next day: this really allows the must to be oxygenated and I notice that the sugars are better finished . La Vortex brings a certain fluidity and oxygenation at a time when you could smash the must because it needs oxygen. The basin with its soft, fluid and harmonious movement is a good compromise.

The third use is also on finished wine from the moment I have a particular reduction: rather than making a classic chutage, to combine the sulfur compounds, bring oxygen and reposition the redox in the center .”

The Coteaux Nantais (Biodynamic Arboriculture)

“To our knowledge, we are the first orchard to be equipped with Vortex, that goes back 15 years, in 2008. We are also one of the first arboreal farms to integrate Biodynamics in France. We created a bean-shaped basin from scratch to create surface movements and convection movements. The water in the basin is exclusively filled with runoff water from the roofs. The 65,000 m3 basin receives water by gravity and all of the water passes through the Vortex. This basin waters 17 ha. We currently have 6 production sites and of the 6 sites, 3 sites are equipped with live basins.

We have excellent water quality: you can see it, at 1m50 deep, we can see the bottom! The Vortex were installed from the start. The pond is full of fish, although we have never put a single fish in it. And above all there is a vigor of this population of fish which is very good: the reproduction is excellent and there is no problem of nitrates, nor of fishy smell. It's as if the basins had accelerated the process of setting up the living and the balance that took place in 2-3 years. Nearby, we have colleagues who have ponds that are about fifteen years old like here, and every summer, they have problems with the development of algae, and fish that die.

It also increases the wetting power of the water. The water is much better absorbed by the plant.

4 years ago, it was very hot, and the buffer basin upstream of the basins filled with lentils. We installed Living Basins on this basin and in one month, the lenses disappeared, on a surface of 1200 m2 and a volume of 6 to 8000 m3. Another anecdote: before putting the basins, there were no cattails. From the moment the basins were put in, the cattails settled in. Since then, the lentils have never come back, even on the following summers when it was too hot.

On the conservation of water, it was also observed that the water which has passed through the basins hardly moves a month and a half later, whereas the control water (i.e. that which has not passed through the basins), begins to turn about ten days later. »

Biodiver.city

"I installed a Live Vasque on my 20 m³ Koi Carp pond, about 7 months ago. The Vortex makes it possible to maintain the state of oxygenation of the basin in a really effective way. Indeed, I only rotate it once a month and the oxygenation rate is sufficient for all of my Koi carp until the following month. »

Vortex basin on an ornamental pond

"The installation of this basin was totally revolutionary... the word is weak. The water has become completely transparent. The Vortex was installed on an ornamental pond which already benefited from a pozzolan filtration system with aquatic plants coupled with the addition of EM (Effective Micro-organisms).

I think the combination Vortex and Effective Microorganisms is just ideal. »

JL. Christophe (Haute-Saone)

Vortex on an ornamental pond

"I finally finished hiding the basin carrying structure with stones. I am delighted with the result on the quality of the water, my pond has never been so clear. Thanks again ! » F.Verchere

Mikinac Association

"Since we installed the Vortex, the water lilies have spread out like never before. They have been there for years and they have never flowered as much as this year. The basin has been there for two months, before there were only a few flowers, and this year there are flowers everywhere. And also the fish have completely changed: they have become much more toned, much more dynamic. The quality of the water has also changed: it has never been so clarified. The general atmosphere of the pool is much livelier, more harmonious, even though the pool has been installed for a few years (since 6 years). »

The Ruée Vegetable Garden (Biodynamic Market Gardening)

“I have had a Vortex for 2 years. I took it because my pond which I use for watering was invaded by algae. It was to avoid lack of oxygen, putrefaction. Feed water is a source. In one month I saw the difference: the water became crystal clear without algae. I also have the feeling that more life has settled around the pond. It's a feeling, I can't certify that either. In terms of the water used to water my seedlings in buckets and tubs in the greenhouse, I gained two more days of humidity for my seedlings compared to water not stirred by Vortex. »

La Ferme de Pibot (arboriculture and laying hens)

“I use the Vortex on my 550 m3 irrigation basin to mix my water and limit the development of algae. It works well ! They are turned on for a few hours a day, varying the switching times during the day to capture the different atmospheres during the day. »

Margarethe Chapel; Wine crystal

“Water that stays intact with a strong stable energy charge, beautiful rhythms, which are distributed with precision and regularity. Powerful and very lively. Looking at it, it's hard to imagine that it could have the same origin as the witness. But by studying it more closely, we find certain morphological criteria which confirm that it is indeed one and the same product. The preservation of innate water balances are enhanced without the drawbacks. »
